Title: Intelligent Agents

AIMA: Chapter 2

Introduction to Artificial Intelligence CSCE 476-876, Spring 2005

 $\mathrm{URL}$ : www.cse.unl.edu/~choueiry/S05-476-876

Berthe Y. Choueiry (Shu-we-ri) choueiry@cse.unl.edu, (402)472-5444

Instructor's notes #4 February 2, 2005

B.Y. Choueiry

2

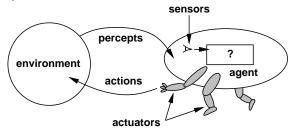

## Intelligent Agents

- 1. Agents and environments
- 2. Rationality
- 3. PEAS
  (Performance measure, Environment, Actuators, Sensors)
- 4. Types of environments
- 5. Types of Intelligent Agents

ಲ

# Agent

Anything that { perceives its environment through sensors acts upon its environment through actuators

**Agents** include: Humans, robots, software, etc. Sensors? Actuators? The **agent function** maps from percept sequences to actions:

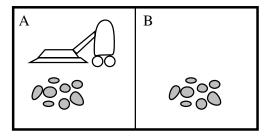

$$f:\mathcal{P}^* o\mathcal{A}$$

The **agent program** runs on the physical **architecture** to produce f

Instructor's notes #4
February 2, 2005

B.Y. Choueiry

## Vacuum-cleaner world

4

**Percepts:** locations and contents, e.g., [A, dirty]

Actions: Left, Right, Suck, NoOp

# A Vacuum-cleaner Agent

| Percept sequence  | Action |
|---|--------|
| [A, Clean]  | Right  |
| A $[A, Dirty]$  | Suck   |
| [B, Clean]  | Left   |
| [B, Dirty]  | Suck   |
| [A, Clean], [A, Clean]  | Right  |
| :   |        |
| $ \left[ A, Clean \right], \left[ A, Clean \right], \left[ A, Clean \right] $ | Right  |
|   |        |

೮

Instructor's notes #4 February 2, 2005

 $\textbf{Function} \ \operatorname{Reflex-Vaccuum-Agent} \ ([location, status]]) \ \textbf{returns} \ \operatorname{an} \ \operatorname{action}$ 

if status = Dirty then return Suck

else if location = A then return Right

else if location = B then return Left

B.Y. Choueiry

## Goal of AI

Build rational agents.

Rational = ?

6

#### What is "rational" depends on:

- 1. Performance measures (how, when)
- 2. The agents' prior knowledge of the environment
- 3. The actions the agent can perform
- 4. Percept sequence to date (history): everything agent has perceived so far

~1

#### Performance meaure

Fixed performance measure evaluates the environment sequence

- one point per square cleaned up in time t
- point per clean square per time step, minus one per move?
- penalize for > k dirty squares?

Instructor's notes #4
February 2, 2005

B.Y. Choueiry

## Rationality

A rational agent chooses whichever action maximizes the expected value of the performance measure given the percept sequence to date

 $\infty$ 

Rational ≠ omniscient, clairvoyant
Rationality maximizes expected performance
Perfection maximizes actual performance

Rational  $\implies$  exploration, learning, autonomy

Instructor's notes #4
February 2, 2005

After a suffficient experience of its environment, behavior of a rational agents becomes effectively undependent of prior knowledge.

## **PEAS**

To design a rational agent, we must specify the task environment

Performance measure?

**Environment?** 

Actuators?

Sensors?

Consider, e.g., the task of designing an automated taxi...

Instructor's notes #4
February 2, 2005

B.Y. Choueiry

10

 $\mathbf{PEAS}$ : Automated taxi

**Performance measure:** safety, destination, profits, legality, comfort,  $\dots$ 

**Environment:** US urban streets, freeways, traffic, pedestrians, stray animals, weather, . . .

Actuators: steering, accelerator, brake, horn, speaker/display, ...

**Sensors:** video, accelerometers, gauges, engine sensors, keyboard, GPS, ...

## Environment (1)

- 1. Fully Observable vs. Partially Observable
- 2. Deterministic vs. stochastic
- 3. Episodic vs. sequential
- 4. Static vs. dynamic
- 5. Discrete vs. continuous
- 6. Single agent vs. multiagent

Instructor's notes #4
February 2, 2005

B.Y. Choueiry

12

## Environment (2)

Fully/Partially Observable: sensors can detect  $\underline{all}$  aspects of the world

Effectively fully observable: <u>relevant</u> aspects

**Deterministic vs. stochastic:** from the agent's view point Next state determined by current state and agents' actions

 $Partially\ observable\ +\ deterministic\ \underline{appears}\ stochastic$ 

**Episodic vs. sequential:** Agent's experience divided into atomic episodes; subsequent episodes do not depend on actions in previous episodes

Instructor's notes #4 February 2, 2005

## Environment (3)

#### Static vs. dynamic:

Dynamic: Environment changes while agent is deliberating Semidynamic: environment static, performance scores dynamic

Discrete vs. continuous: Finite number of precepts, actions

**Single agent vs. multiagent:** B's behavior maximizes a performance measure whose value depends on A's behavior. Cooperative, competitive, communication.

Chess? Taxi driving?

hardest case?

B.Y. Choueiry

#### Environment (4)

Hardest case: patially observable, stochastic, sequential, dynamic, continuous, and multiagent

|               | Solitaire | Backgammon | Internet shopping | Taxi |
|---------------|-----------|------------|-------------------|------|
| Observable    |           |            |                   |      |
| Deterministic |           |            |                   |      |
| Episodic      |           |            |                   |      |
| Static        |           |            |                   |      |
| Discrete      |           |            |                   |      |
| Single-agent  |           |            |                   |      |

Answers depend on how you define/interpret the case

Episodic: chess tournament

14

# Instructor's notes #4 February 2, 2005

# Environment types

|               | Solitaire         | Backgammon | Internet shopping | Taxi |
|---------------|-------------------|------------|-------------------|------|
| Observable    | Yes               | Yes        | No                | No   |
| Deterministic | Yes               | No         | Partly            | No   |
| Episodic      | No                | No         | No                | No   |
| Static        | Yes               | Semi       | Semi              | No   |
| Discrete      | Yes               | Yes        | Yes               | No   |
| Single-agent  | Yes               | No         | Yes               | No   |
|               | (except auctions) |            |                   |      |

The environment type largely determines the agent design

The real world is (of course) partially observable, stochastic, sequential, dynamic, continuous, multi-agent

B.Y. Choueiry

# Types of Agents

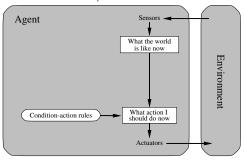

Four, in order of increasing generality:

- 1. Simple reflex agents
- 2. Simple reflex agents with state
- 3. Goal-based agents
- 4. Utility-based agents
- 5. Learning agents

All these can be turned into learning agents.

### Simple reflex agents

- Simple look-up table, mapping percepts to actions, is out of question (too large, too expensive to build)
- Many situations can be summarized by condition-action rules (humans: learned responses, innate reflexes)

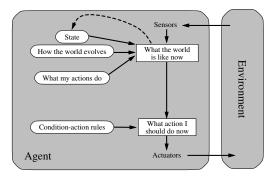

Implementation: easy; Applicability: narrow

B.Y. Choueiry

### Simple reflex agents with state

- Sensory information alone is not sufficient
- Need to keep track of how the world evolves (evolution: independently of agent, or caused by agent's actions)

18

How the world evolved: model-based agent

## Goal-based agents

- State & actions don't tell where to go
- Need goals to build sequences of actions (planning)

State What the world is like now How the world evolves What it will be like if I do action A What my actions do What action I should do now Goals Agent

Goal-based: uses the same rules for different goals Reflex: will need a complete set of rules for each goal

Instructor's notes #4 February 2, 2005

B.Y. Choueiry

#### Utility-based agents

- Several action sequences to achieve some goal (binary process)
- Need to <u>select</u> among actions & sequences. Preferences.

State

How the world evolves

What my actions do

Utility

Agent

• Utility: State → real number (express degree of satisfaction, specify trade-offs between conflicting goal)

What the world is like now

What it will be like if I do action A

How happy I will be in such a state

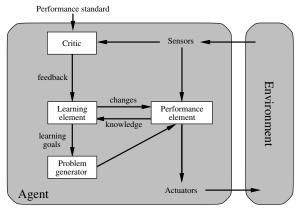

What action I should do now

Environment

20

## Learning agents

Agent operates in an initially unknown environment, and becomes more competent than its initial knowledge alone might allow

Learning: process of modification of each component of the agent to bring the components into closer agreement with the available feedback information, thus improving overall performance of the agent.
