ructor's notes #8 fovember 20, 2006

B.Y. Choueiry

Outline

- Problem definition and examples
- Solution techniques: search and constraint propagation
- Deeper analysis
- Research directions

4

ರ

What is this about?

Context: You are a senior in college

Problem: You need to register in 4 courses for Fall'2006

Possibilities: Many courses offered in Math, CSE, EE, etc.

Constraints: restrict the choices you can make

• Unary: Courses have prerequisites you have/don't have Courses/instructors you like/dislike

- Binary: Courses are scheduled at the same time
- *n-ary:* In CompEng, 4 courses from 5 tracks such as at least 3 tracks are covered

You have choices, but are restricted by constraints

→ Make the right decisions

Instructor's notes #8 November 20, 2006

B.Y. Choueiry

Constraint Satisfaction

Given

• A set of variables

4 courses at UNL

- For each variable, a set of choices (values)
- A set of constraints that restrict the combinations of values the variables can take at the same time

6

Questions

• Does a solution exist?

classical decision problem

- How two or more solutions differ? How to change specific choices without perturbing the solution?
- If there is no solution, what are the sources of conflicts? Which constraints should be retracted?
- \bullet etc.

Constraint Processing is about

- solving a decision problem
- \bullet while allowing the user to state $\underline{\text{arbitrary}}$ constraints in an expressive way and
- providing concise and high-level feedback about alternatives and conflicts

7

Power of Constraints Processing

- flexibility & expressiveness of representations
- interactivity, users can $\left\{\begin{array}{c} \text{relax} \\ \text{reinforce} \end{array}\right\}$ constraints

Related areas: AI, OR, Algorithmic, DB, Prog. Languages, etc.

tructor's notes #8

Definition

Given $\mathcal{P} = (\mathcal{V}, \mathcal{D}, \mathcal{C})$:

• V a set of variables

 $\mathcal{V} = \{V_1, V_2, \dots, V_n\}$

 ∞

- \mathcal{D} a set of variable domains (domain values) $\mathcal{D} = \{D_{V_1}, D_{V_2}, \dots, D_{V_n}\}$
- C a set of constraints

 $C_{V_a,V_b,\ldots,V_i} = \{(x,y,\ldots,z)\} \subseteq D_{V_a} \times D_{V_b} \times \ldots \times D_{V_i}$

Query: can we find one value for each variable such that all constraints are satisfied?

In general, NP-complete

Terminology

9

- Instantiating a variable: $V_i \leftarrow a$ where $a \in D_{V_i}$
- Partial assignment
- Consistent assignment
- Objective function (constrained optimization problem)

Instructor's notes #8 November 20, 2006

B.Y. Chouei

Representation

Given
$$\mathcal{P} = (\mathcal{V}, \mathcal{D}, \mathcal{C})$$

$$\begin{cases} \mathcal{V} = \{V_1, V_2, \dots, V_n\} \\ \mathcal{D} = \{D_{V_1}, D_{V_2}, \dots, D_{V_n}\} \\ \mathcal{C} \text{ set of constraints} \end{cases}$$

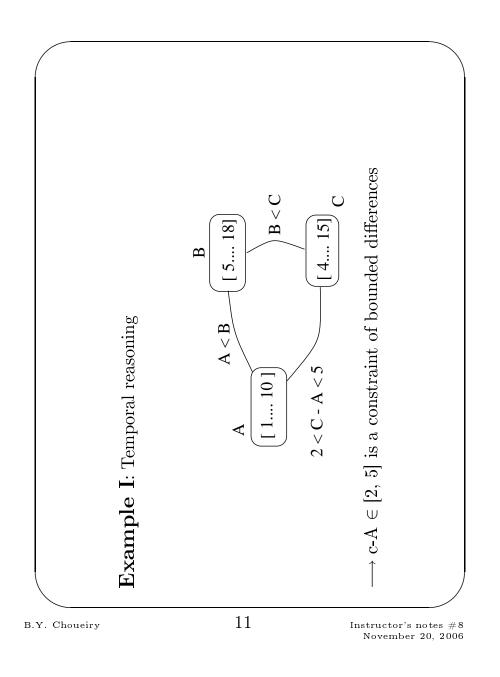

$$C_{V_i,V_j} = \{ (x,y) \} \subseteq D_{V_i} \times D_{V_j}$$

Constraint graph

$$v1$$
 $\{1, 2, 3, 4\}$ $v1 < v2$ $\{3, 6, 7\}$ $v2$ $v1+v3 < 9$ $v2 < v3$ $v2 > v4$ $v3$ $\{3, 4, 9\}$ $v3$ $\{3, 4, 9\}$ $v4$

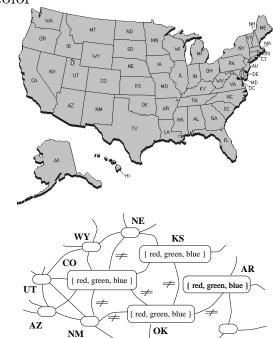

10

November 20, 2006

$\mathbf{Example} \ \mathbf{II} \text{:} \ \mathrm{Map \ coloring}$

Using 3 colors (R, G, & B), color the US map such that no two adjacent states do have the same color

Variables? Domains? Constraints?

November 20, 2006

Incremental formulation: as a search problem

Initial state: empty assignment, all variables are unassigned

Successor function: a value is assigned to any unassigned variable, provided that it does not conflict with previously assigned variables (back-checking)

Goal test: The current assignment is complete (and consistent)

Path cost: a constant cost (e.g., 1) for every step, can be zero

— A solution is a complete, consistent assignment.

- Search tree has constant depth $n \ (\# \text{ of variables}) \to \text{DFS}!!$
- Path for reaching a solution is irrelevant
- A complete-state formulation is OK
- local-search techniques applicable

B.Y. Choueiry

Instructor's notes #8 November 20, 2006

Domain types

Given
$$\mathcal{P} = (\mathcal{V}, \mathcal{D}, \mathcal{C})$$

$$\begin{cases} \mathcal{V} = \{V_1, V_2, \dots, V_n\} \\ \mathcal{D} = \{D_{V_1}, D_{V_2}, \dots, D_{V_n}\} \\ \mathcal{C} \text{ set of constraints} \end{cases}$$

$$C_{V_i,V_j} = \{ (x,y) \} \subseteq D_{V_i} \times D_{V_j}$$

Domains:

- \longrightarrow restricted to $\{0, 1\}$: Boolean CSPs
- → Finite (discrete): enumeration techniques works
- Continuous: sophisticated algebraic techniques are needed consistency techniques on domain bounds

14

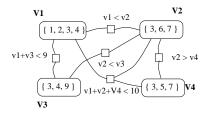

Constraint arity

$$\begin{aligned} \mathbf{Given} \ \mathcal{P} &= (\mathcal{V}, \mathcal{D}, \mathcal{C}) \ \begin{cases} \ \mathcal{V} &= \{V_1, V_2, \dots, V_n\} \\ \ \mathcal{D} &= \{D_{V_1}, D_{V_2}, \dots, D_{V_n}\} \\ \ \mathcal{C} \ \text{ set of constraints} \end{cases} \\ C_{V_k, V_l, V_m} &= \{(x, y, z)\} \subseteq D_{V_k} \times D_{V_l} \times D_{V_m} \end{cases}$$

15

Constraints: universal, unary, binary, ternary, ..., global

Representation: Constraint network

Instructor's notes #8 November 20, 2006

B.Y. Choueiry

16

Constraint language

Constraints can be defined

• Extensionally: all allowed tuples are listed practical for defining arbitrary constraints

• Intensionally: when it is not practical (or even possible) to list all tuples

 \rightarrow define types of common constraints, which can be used repeatedly

Examples of types of constraints: linear constraints, nonlinear constraints, Alldiff (a.k.a. mutex), Atmost, constraints of bounded differences (e.g., in temporal reasoning), etc.

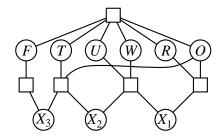

Instructor's notes #8 November 20, 2006

Example III: Cryptarithmetic puzzles

$$D_{X1} = D_{X2} = D_{X3} = \{0, 1\}$$

 $D_F = D_T = D_U = D_V = D_R = D_O = [0, 9]$

(b)

(a)

$$O + O = R + 10 X1$$

$$X1 + W + W = U + 10 X2$$

$$X2 + T + T = O + 10 X3$$

$$X3 = F$$

 $Alldiff(\{F,\,D,\,U,\,V,\,R,\,O\})$

B.Y. Choueiry

How to solve a CSP?

18

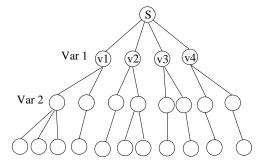

Search!

- 1. Constructive, systematic search
- 2. Iterative repair search

Systematic search

- \rightarrow Starting from a root node
- \rightarrow Consider all values for a variable V_1
- \rightarrow For every value for V_1 , consider all values for V_2
- \rightarrow etc..

19

For n variables, each of domain size d:

- Maximum depth?

fixed!

- Maximum number of paths? size of search space, size of CSP

Instructor's notes #8 November 20, 2006

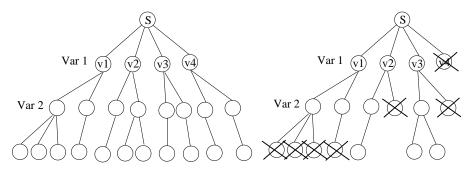

B.Y. Choueiry

Back-checking

Systematic search generates d^n possibilities

Are all possible combinations acceptable?

20

- → Expand a partial solution only when consistent
- ---- early pruning

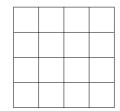

Before looking at search..

Consider

- 1. Importance of modeling/formulating to control the size of the search space
- 2. Preprocessing: consistency filtering to reduce size of search space

Importance of modeling

N-queens: formulation 1

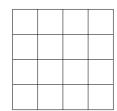

Variables?

Domains?

Size of CSP?

N-queens: formulation 2

variables?

domains?

size of csp?

Constraint checking

— Constraint filtering, constraint checking, etc.. eliminate non-acceptable tuples prior to search

B
1-B: [5...14]
C: [6...15]
B < C
2-A: [2...10]
C: [6...14]

2 < C - A < 5

[4....15]
C

23

 \longrightarrow Arc-Consistency:

 $AC(C_{V_1,V_2}) = REVISE(V_1,V_2)$ and $REVISE(V_2,V_1)$

 \longrightarrow CSP is AC when all constraints are AC.

 \longrightarrow Algorithms: AC-1, AC-2, **AC-3**, ..., **AC-7** and back to **AC-3**

 \longrightarrow AC-3: $O(n^2d^3)$

B.Y. Choueiry

Instructor's notes #8 November 20, 2006

Warning: arc-consistency does not solve the problem

$$\begin{array}{c}
A \\
\hline{\{1,2,3\}}
\end{array}
=
\begin{array}{c}
B \\
\hline{\{2,3,4\}}
\end{array}$$

$$\begin{array}{c}
A \\
\hline{\{2,3\}}
\end{array}$$

 $(A=2) \wedge (B=3)$ still isn't a solution!

24

- In general, constraint propagation helps, but does not solve the problem
- As long as constraint checking is affordable (i.e., cost remains negligible vis-a-vis cost of search), it is advantageous to apply before

Instructor's notes #8 November 20, 2006

Levels of consistency

Node consistency: every value in the domain of a variable is consistent with the unary constraints defined on the variable

Arc-consistency: For any value in the domain of any variable, there is at least one value in the domain of any other variable with which it is consistent.

3-consistency: For any two consistent values in the domains of any two variables, there is at least one value in the domain of any third variable with which they are consistent.

k-consistency: $(k \le n)$

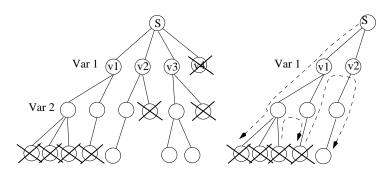

For any (k-1) consistent values in the domains of any (k-1) variables, there is at least one value in the domain of any k^{th} variable with which they are consistent.

Strong k-consistency: k-consistency $\forall i \leq k$

B.Y. Choueiry

Chronological backtracking

What if only <u>one</u> solution is needed?

26

 $\longrightarrow \mathbf{Depth\text{-}first\ search\ \&\ chronological\ backtracking}]] \longrightarrow$

Terms: current variable V_c , past variables \mathcal{V}_p , future variables \mathcal{V}_f , current path

 \rightarrow DFS: soundness? completeness?

Backtrack(ing) search (BT)

Refer to algorithm BACKTRACKING-SEARCH

28

- Implementation: Backtracking-Search Careful, recursive, do not implement!! Use [Prosser 93] for iterative versions
- Variable ordering heuristic: Select-Unassigned-Variable
- Value ordering heuristic: Order-Domain-Values

Improving BT

General purpose methods for:

1. Variable, value ordering

2. Improving backtracking: intelligent backtracking avoids repeating failure

3. Look-ahead techniques: constraint propagation as instantiations are made

Instructor's notes #8 November 20, 2006

B.Y. Choueiry

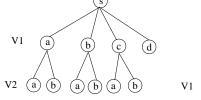

Ordering heuristics

Which variable to expand first?

Exp:
$$V_1, V_2, D_{V_1} = \{a, b, c, d\}, D_{V_2} = \{a, b\}$$

Sol:
$$\{(V_1 = c), (V_2 = a)\}$$
 and $\{(V_1 = c), (V_2 = b)\}$

30

Instructor's notes #8 November 20, 2006

Heuristics:

 $\frac{\rm constrained}{\rm most} \ \frac{\rm constrained}{\rm variable} \ {\rm first} \ ({\rm reduce} \ {\rm branching} \ {\rm factor})$

Examples of ordering heuristics

For variables:

- least domain (LD), aka minimum remaining values (MRV
- degree
- ratio of domain size to degree (DD)
- width, promise, etc. [Tsang, Chapter 6]

For values:

- min-conflict [Minton, 92]
- promise [Geelen, 94], etc.

Strategies for $\left\{\begin{array}{c} \text{variable ordering} \\ \text{value ordering} \end{array}\right\}$ could be $\left\{\begin{array}{c} \text{static} \\ \text{dynamic} \end{array}\right.$

Instructor's notes #8 November 20, 2006

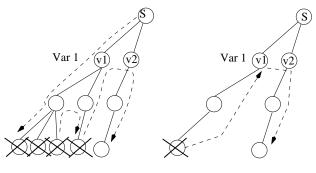

B.Y. Choueiry

Intelligent backtracking

What if the reason for failure was higher up in the tree?

Backtrack to source of conflict!!

<u>ئ</u>ر

- \rightarrow Backjumping, conflict-directed backjumping, etc.
- \rightarrow Additional data structures that keep track of failure encountered during back-checking $_{\rm [Prosser,\ 93]}$

33

Look-ahead strategies: partial or full

As instantiations are made, remove the values from the domain of future variables that are not consistent with the current path

Terminology

- V_c is the current variable
- \mathcal{V}_f is the set of future variables, V_f is a future variable
- Instantiate V_c , update the domains of (some) future variables

Strategies

- Forward checking (FC): partial look-ahead
- Directed arc-consistency checking (DAC): partial look-ahead
- Maintaining Arc-Consistency (MAC): full look-ahead
- → Special data structures can be used to refresh filtered domains upon backtracking [Prosser, 93]

Instructor's notes #8 November 20, 2006

B.Y. Choueiry

Forward checking (FC)

 \rightarrow Apply Revise (V_f, V_c) to the each variable V_f connected to V_c

 \rightarrow In AIMA, it is Remove-Inconsistent-Values (V_f, V_c)

Procedure:

- Instantiate V_c
- Apply Revise (V_f, V_c) to the each variable V_f

Direct Arc-Consistency (DAC)

- \rightarrow Repeat forward checking on all $V_f \in \mathcal{V}_f$ while respecting order
- \rightarrow Applicable under static ordering

35

Procedure:

- Choose a variable ordering
- Instantiate V_c
- Apply FC to V_c
- Move to next variable V_f in ordering, and apply FC to V_f . Repeat for all variables in \mathcal{V}_f in the specified order.

Instructor's notes #8 November 20, 2006

B.Y. Choueiry

Maintaining Arc-Consistency (MAC)

- \rightarrow Maintain AC in the subproblem induced by $\mathcal{V}_f \cup \{V_c\}$
- \rightarrow In practice, useful when problem has few, tight constraints

 $\frac{3}{2}$

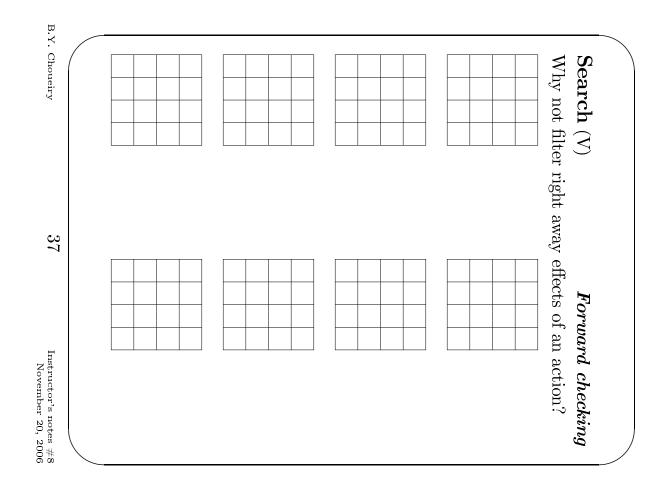

Procedure:

- Instantiate V_c
- Apply AC-3($V_f \cup \{V_c\}$)

 Every constraint revision uses two operations: Revise(V_a, V_b)

 and Revise(V_b, V_a)

Updates domains of all variables in subproblems

CSP: a decision problem (NP-complete)

1- Modeling:

— abstraction and reformulation

2- Preprocessing techniques:

— eliminate non-acceptable tuples prior to search

3- Search:

- potentially d^n paths of fixed length
- chronological backtracking
- variable/value ordering heuristics
- intelligent backtracking

4- Search 'hybrids':

— Mixing preprocessing with search: FC, DAC, MAC

38

٠.٠

Instructor's notes #8 November 20, 2006

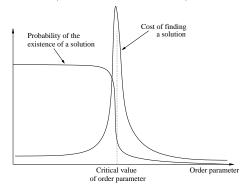

Non-systematic search

- Methodology: Iterative repair, local search: modifies a global but <u>inconsistent</u> solution to decrease the number of violated constraints
- Example: MIN-CONFLICTS algorithm in Fig 5.8, page 151. Choose (randomly) a variable in a broken constraint, and change its value using the min-conflict heuristic (which is a value ordering heuristic)
- Other examples: Hill climbing, taboo search, simulated annealing, etc.
- \longrightarrow Anytime algorithm
- → Strategies to avoid getting trapped: RandomWalk
- → Strategies to recover: Break-Out, Random restart, etc.
- \longrightarrow Incomplete & not sound

B.Y. Choueiry

Deep analysis: Uncover particular properties, e.q.

- bounds the required level of consistency
- predicts ease/difficulty of solving a given instance
- C-graph topology: tree (see Section 5.4), chordal, etc.
- Constraints type: Alldiffs, Atmost, functional, monotonic, row-convex, subsets of Allen's relations, etc.
- Order parameter (phase transition)

40

Exploiting structure: example of deep analysis

41

Tree-structured CSP

- Cycle-cutset method
- Tree-decomposition method (not discussed, Yaling's research)

Instructor's notes #8 November 20, 2006

B.Y. Choueiry

Tree-structured CSP

Any tree-structured CSP can be solved in time linear in the number of variables.

42

- Apply arc-consistency (directional arc-consistency is enough)
- Proceed instantiating the variables from the root to the leaves
- \bullet The assignment can be done in a backtrack-free manner
- Runs in $O(nd^2)$, n is #variables and d domain size.

Instructor's notes #8 November 20, 2006

Cycle-cutset method

- 1. Identify a cycle cutset S in the CSP (nodes that when removed yield a tree), the remaining variables form the set T
- 2. Find a solution to the variables in S (S is smaller than initial problem)
- 3. For every consistent solution for variables in S:
 - $\bullet \ \mbox{Apply DAC}$ from S to T
 - If no domain is wiped out, solve T (quick) and you have a solution to the CSP

Note:

- For a cycle cutset |S| = c, time is $O(d^c \cdot (n-c)d^2)$. If graph is nearly a tree, c is small, and savings are large. In the worst-case, c = n 2:—(.
- Finding the smallest cutset is NP-hard :-(

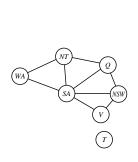

B.Y. Choueiry

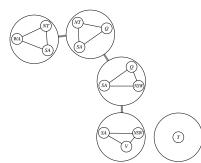

Tree decomposition (tree-clustering)

Cluster the nodes of the CSP into subproblems, which are organized in a tree structure:

- Every variable appears in at least one subproblem
- If 2 variables are connected by a constraint, they must appear together (along with the constraint) in at least one subproblem
- If a variable appears in 2 subproblems, it must appear in every suproblem along the path between the 2 subproblems.

44

${\bf Solving \ the \ tree \ decomposition} \ ({\it tree-clustering})$

- Each subproblem is a meta-variable, whose domain is the set of all solutions to the subproblem.
- Choose a subproblem, find all its solutions.
- Solve the constraints connecting the subproblem and its neighbors (common variables must agree).
- Repeat the process from a node to its descendant.
- Complexity depends on w, the tree width of the decomposition = number of nodes in largest subproblem 1. It is $O(nd^{w+1})$.
- Thus, CSPs with a constraint graph of bounded w can be solved in polynomial time.
- Finding the decomposition with minimal tree width in NP-hard..

or's notes #8 aber 20, 2006

B.Y. Choueiry

Research directions

Preceding (i.e., search, backtrack, iterative repair, V/V/ordering, consistency checking, decomposition, symmetries & interchangeability, deep analysis) $+ \dots$

Evaluation of algorithms:

worst-case analysis vs. empirical studies random problems?

46

Cross-fertilization:

SAT, DB, mathematical programming, interval mathematics, planning, etc.

Modeling & Reformulation

Multi agents:

Distribution and negotiation

 \rightarrow decomposition & alliance formation

CSP in a nutshell (II)

48

k-ary constraints, soft constraints Research: { evaluation of algorithms (empirical) cross-fertilization. cross-fertilization (mathematical program.)

- ♡ reformulation and approximation♡ architectures (multi-agent, negotiation)

${\bf Constraint} \ {\bf Logic} \ {\bf Programming} \ ({\tt CLP})$

A merger of

 $\sqrt{}$ Constraint solving

 \longrightarrow Logic Programming, mostly Horn clauses (e.g., Prolog)

Building blocks

- Constraint: primitives but also user-defined
 - cumulative/capacity (linear ineq), MUTEX, cycle, etc.
 - domain: Booleans, natural/rational/real numbers, finite
- Rules (declarative): a statement is a conjunction of constraints and is tested for satisfiability before execution proceeds further
- Mechanisms: satisfiability, entailment, delaying constraints

5 00

Your future: jobs

Commercial companies: i2 Technologies, Ilog, PeopleSoft/Red Pepper, Honeywell, Xerox Corp, etc.

Prestigious research centers: NASA Ames, JPL, BT Labs (UK), IBM Watson+Almaden, etc.

Start your own: *i*2 technologies started as a small group of researchers doing constraint-based scheduling

Academic: constraint languages, modeling, representation, automated reasoning, etc.

B.Y. Choueiry

50

Constraint Processing Techniques are the basis of new languages:

Were you to ask me which programming paradigm is likely to gain most in commercial significance over the next 5 years I'd have to pick Constraint Logic Programming (CLP), even though it's perhaps currently one of the least known and understood. That's because CLP has the power to tackle those difficult combinatorial problems encountered for instance in job scheduling, timetabling, and routing which stretch conventional programming techniques beyond their breaking point.

Though CLP is still the subject of intensive research, it's already being used by large corporations such as manufacturers Michelin and Dassault, the French railway authority SNCF, airlines Swissair, SAS and Cathay Pacific, and Hong Kong International Terminals, the world's largest privately-owned container terminal.

Byte, Dick Pountain
