Instructor's notes #11 March 31, 2006

B.Y. Choueiry

2

Outline

- Login in general: models and entailment
- Propositional (Boolean) logic
- $\bullet\,$ Equivalence, validity and satisfiability
- Inference:
 - By model checking
 - Using inference rules
 - Resolution algorithm: Conjunctive Normal form
 - Horn theories: forward and backward chaining

ಲ

A logic consists of:

- 1. A formal representation system:
 - (a) Syntax: how to make sentences
 - (b) Semantics: systematics constraints on how sentences relate to the states of affairs
- 2. Proof theory: a set of rules for deducing the entailment of a set of sentences

Example:

- $\sqrt{\text{Propositional logic (or Boolean logic)}}$
- $\sqrt{\text{First-order logic FOL}}$

Instructor's notes #11 March 31, 2006

B.Y. Choueiry

Models (I)

A model is a world in which a sentence is true under a particular interpretation.

General definition

4

Logicians typically think in terms of <u>models</u>, which are formally <u>structured</u> worlds with respect to which truth can be evaluated

We say m is a model of a sentence α if α is true in m

Typically, a sentence can be true in many models

ರ

Models (II)

 $M(\alpha)$ is the set of all models of α

Entailment: A sentence α is entailed by a KB if the models of the KB are all models of α

 $KB \models \alpha \text{ iff all models of } KB \text{ are models of } \alpha \ (i.e., M(KB) \subseteq M(\alpha))$

Then KB $\models \alpha$ if and only if $M(KB) \subseteq M(\alpha)$

Instructor's notes #11 March 31, 2006

B.Y. Choueiry

6

Inference

- Example of inference procedure: deduction
- Validity of a sentence: always true (i.e., under all possible interpretations)

The Earth is round or not round

- \rightarrow Tautology
- \bullet Satisfiability of a sentence: sometimes true (i.e., \exists some interpretation(s) where it holds)

Alex is on campus

• Insatisfiability of a sentence: never true (i.e., ∄ any interpretation where it holds)

The Earth is round and the earth is not round

 \rightarrow useful for refutation, as we will see later

Beauty of inference:

Formal inference allows the computer to derive <u>valid</u> conclusions even when the computer does not know the interpretation you are using

~1

Syntax of Propositional Logic

Propositional logic is the simplest logic—illustrates basic ideas

- Symbols represent whole propositions, sentences **D** says the Wumpus is dead The proposition symbols P_1 , P_2 , etc. are sentences
- Boolean <u>connectives</u>: $\land, \lor, \neg, \Rightarrow$ (alternatively, \rightarrow, \supset), \Leftrightarrow , connect sentences

If S_1 and S_2 are sentences, the following are sentences too: $\neg S_1, \ \neg S_2, \ S_1 \land S_2, \ S_1 \lor S_2, \ S_1 \Rightarrow S_2, \ S_1 \Leftrightarrow S_2$

Formal grammar of Propositional Logic: Backus-Naur Form, check Figure 7.7 page 205 in AIMA

Instructor's notes #11 March 31, 2006

B.Y. Choueiry

Terminology

Atomic sentence: single symbol

Complex sentence: contains connectives, parentheses

Literal: atomic sentence or its negation (e.g., P, $\neg Q$)

Sentence $(P \wedge Q) \Rightarrow R$ is an implication, conditional, rule, if-then statement

> $(P \wedge Q)$ is a premise, antecedent R is a conclusion, consequence

Sentence $(P \wedge Q) \Leftrightarrow R$ is an equivalence, biconditional

Precedence order resolves ambiguity (highest to lowest):

$$\neg, \wedge, \vee, \Rightarrow, \Leftrightarrow$$
 E.g., $((\neg P) \vee (Q \wedge R)) \Rightarrow S$ Careful: $A \wedge B \wedge C$ and $A \Rightarrow B \Rightarrow C$

 ∞

B.Y. Choueiry

Syntax of First-order logic

(Chapter 8)

First-Order Logic (FOL) is expressive enough to say almost anything of interest and has a sound and complete inference procedure

- Logical symbols:
 - parentheses
 - connectives $(\neg, \Rightarrow, \text{ the rest can be regenerated})$
 - variables
 - equality symbol (optional)
- Parameters:
 - quantifier ∀
 - predicate symbols
 - constant symbols
 - function symbols

Instructor's notes #11 March 31, 2006

Semantics of Propositional Logic

Semantics is defined by specifying:

- Interpretation of a proposition symbols and constants (T/F)
- Meaning of logical connectives

Proposition symbol means what ever you want:

D says the Wumpus is dead

Breeze says the agent is feeling a breeze

Stench says the agent is perceiving an unpleasant smell

Connectives are functions: complex sentences meaning derived from the meaning of its parts

P	Q	$\neg P$	$P \wedge Q$	$P \lor Q$	$P \Rightarrow Q$	$P \Leftrightarrow Q$
False	False	True	False	False	True	True
False	True	True	False	True	True	False
True	False	False	False	True	False	False
True	True	False	True	True	True	True

Note:

 $P \Rightarrow Q$: if P is true, Q is true, otherwise I am making no claim

B.Y. Choueiry

10

- A model is a <u>mapping</u> from proposition symbols directly to truth or falsehood
- The models of a sentence are the mappings that make the sentence true

Example:

 α : obj1 \wedge obj2

 $\sqrt{\text{Model1: obj1} = 1 \text{ and obj2} = 1}$

 \times Model2: obj1 = 0 and obj2 =1

Instructor's notes #11 March 31, 2006

B.Y. Choueiry

12

Wumpus world in Propositional Logic

 $P_{i,j}$: there is a pit in [i,j]

 $B_{i,j}$: there is a breeze in [i,j]

- $R_1 : \neg P_{1,1}$
- "Pits cause breezes in adjacent squares"

 $R_2: B_{1,1} \Leftrightarrow (P_{1,2} \vee P_{2,1})$

 $R_3: B_{2,1} \Leftrightarrow (P_{1,1} \vee P_{2,2} \vee P_{3,1})$

• Percepts:

 $R_4: \neg B_{1,1}$

 $R_5: B_{2,1}$

- KB: $R_1 \wedge R_2 \wedge R_3 \wedge R_4 \wedge R_5$
- Questions: KB $\models \neg P_{1,2}$? KB $\not\models P_{2,2}$?

Wumpus world in Propositional Logic

Given KB: $R_1 \wedge R_2 \wedge R_3 \wedge R_4 \wedge R_5$

Number of symbols: 7

Number of models: $2^7 = 128$

<See Figure 7.9, page 209>

KB is true in only 3 models

 $P_{1,2}$ is false but $\neg P_{1,2}$ holds in all 3 models of the KB, thus KB $\models \neg P_{1,2}$

 $P_{2,2}$ is true in 2 models, false in third, thus KB $\not\models P_{2,2}$

B.Y. Choueiry

Instructor's notes #11 March 31, 2006

Enumeration method in Propositional Logic

Let $\alpha = A \vee B$ and $KB = (A \vee C) \wedge (B \vee \neg C)$

Is it the case that $KB \models \alpha$?

Check all possible models— α must be true wherever KB is true

A	В	C	$A \lor C$	$B \vee \neg C$	KB	α
F	F	F				
F	F	T				
F	T	F				
F	T	T				
T	F	F				
T	F	T				
T	T	F				
T	T	T				

Complexity? Inference is exponential in propositional logic

14

Inference by enumeration

- Algorithm: TT-ENTAILS?(KB, α), Figure 209
 - Identifies all the symbols in kb
 - Performs a recursive enumeration of all possible assignments (T/F) to symbols
 - In a depth-first manner
- It terminates: there is only a finite number of models
- It is sound: because it implements definition of entailment
- ullet It is complete, and works for any KB and lpha
- Time complexity: $O(2^n)$, for a KB with n symbols
- Alert: Entailment in Propositional Logic is co-NP-Complete

tructor's notes #11 March 31, 2006

B.Y. Choueiry

Important concepts

16

- Logical equivalence
- Validity

Deduction theorem: links validity to entailment

• Satisfiability

Refutation theorem: links satisfiability to entailment

Logical equivalence

Two sentences are logically equivalent $\alpha \Leftrightarrow \beta$ iff true in same models

 $\alpha \equiv \beta$ if and only if $\alpha \models \beta$ and $\beta \models \alpha$

Instructor's notes #11 March 31, 2006

```
(\alpha \wedge \beta) \equiv
                                (\beta \wedge \alpha) commutativity of \wedge
          (\alpha \vee \beta) \equiv (\beta \vee \alpha) commutativity of \vee
((\alpha \wedge \beta) \wedge \gamma) \equiv (\alpha \wedge (\beta \wedge \gamma)) associativity of \wedge
((\alpha \lor \beta) \lor \gamma) \equiv (\alpha \lor (\beta \lor \gamma)) associativity of \lor
           \neg(\neg \alpha) \equiv \alpha double-negation elimination
   (\alpha \implies \beta) \equiv (\neg \beta \implies \neg \alpha) contraposition
   (\alpha \implies \beta) \equiv (\neg \alpha \lor \beta) implication elimination
        (\alpha \Leftrightarrow \beta) \equiv ((\alpha \Longrightarrow \beta) \land (\beta \Longrightarrow \alpha)) biconditional elimination
       \neg(\alpha \land \beta) \equiv (\neg \alpha \lor \neg \beta) de Morgan
       \neg(\alpha \lor \beta) \equiv (\neg \alpha \land \neg \beta) de Morgan
(\alpha \wedge (\beta \vee \gamma)) \equiv ((\alpha \wedge \beta) \vee (\alpha \wedge \gamma)) distributivity of \wedge over \vee
(\alpha \vee (\beta \wedge \gamma)) \equiv ((\alpha \vee \beta) \wedge (\alpha \vee \gamma)) distributivity of \vee over \wedge
```

B.Y. Choueiry

Validity

A sentence is valid if it is true in all models

$$e.g., P \vee \neg P$$

$$P \Rightarrow P$$

$$e.q., P \lor \neg P, \qquad P \Rightarrow P, \qquad (P \land (P \Rightarrow H)) \Rightarrow H$$

To establish validity, use truth tables:

P	H	$P \lor H$	$(P \lor H) \land \neg H$	$((P \lor H) \land \neg H) \Rightarrow P$
False	False	False	False	True
False	True	True	False	True
True	False	True	True	True
True	True	True	False	True

18

If every row is true, then he conclusion, P, is entailed by the premises, $((P \vee H) \wedge \neg H)$

Use of validity: <u>Deduction Theorem</u>:

$$KB \models \alpha \text{ iff } (KB \Rightarrow \alpha) \text{ is valid}$$

TT-ENTAILS?(KB, α) checks the validity of (KB $\Rightarrow \alpha$)

B.Y. Choueiry

Satisfiability

A sentence is <u>satisfiable</u> if it is true in <u>some</u> model $e.g., A \vee B, C$

10

Satisfiability can be checked by enumerating the possible models until one is found that satisfies the sentence (e.g., SAT!)

A sentence is <u>unsatisfiable</u> if it is true in <u>no</u> models e.g., $A \land \neg A$

Instructor's notes #11 March 31, 2006 Satisfiability and validity are connected:

 α valid iff $\neg \alpha$ is unsatisfiable and α satisfiable iff $\neg \alpha$ is not valid

Use of satisfiability: refutation

 $KB \models \alpha \text{ iff } (KB \land \neg \alpha) \text{ is unsatisfiable}$

i.e., prove α by reductio ad absurdum

B.Y. Choueiry

20

Proof methods

Proof methods divide into (roughly) two kinds Model checking

- Truth-table enumeration (sound & complete but exponential)
- Backtrack search in model space (sound & complete) e.g., Davis-Putnam Algorithm (DPLL) (Section 7.6)

• Heuristic search in model space (sound but incomplete) e.g., the GSAT algorithm, the WalkSat algorithm (Section 7.6)

Application of inference rules

- Legitimate (sound) generation of new sentences from old
- <u>Proof</u> = a sequence of inference rule applications, can use inference rules as operators in a standard search algorithm
- Typically require translation of sentences into a normal form

Inference rules for Propositional Logic (I)

Reasoning patterns

• Modus Ponens (Implication-Elimination)

$$\frac{\alpha \Rightarrow \beta, \ \alpha}{\beta}$$

21

• And-Elimination

$$\frac{\alpha_1 \wedge \alpha_2 \wedge \ldots \wedge \alpha_n}{\alpha_i}$$

• We can also use all logical equivalences as inference rules:

$$\frac{\alpha \Leftrightarrow \beta}{(\alpha \Rightarrow \beta) \land (\beta \Rightarrow \alpha)}$$
 and $\frac{(\alpha \Rightarrow \beta) \land (\beta \Rightarrow \alpha)}{\alpha \Leftrightarrow \beta}$

Soundness of an inference rule can be verified by building a truth table

B.Y. Choueiry

Instructor's notes #11 March 31, 2006

Inference rules and equivalences in the wumpus world

Given KB: $R_1 \wedge R_2 \wedge R_3 \wedge R_4 \wedge R_5$

Prove: $\neg P_{1,2}$

• Biconditional elimination to $R_2: B_{1,1} \Leftrightarrow (P_{1,2} \vee P_{2,1})$

 $R_6: (B_{1,1} \Rightarrow (P_{1,2} \vee P_{2,1})) \wedge ((P_{1,2} \vee P_{2,1}) \Rightarrow B_{1,1})$

• And elimination to R_6 :

$$R_7: ((P_{1,2} \vee P_{2,1}) \Rightarrow B_{1,1})$$

• Logical equivalence of contrapositives:

$$R_8: (\neg B_{1,1} \Rightarrow \neg (P_{1,2} \lor P_{2,1}))$$

• Modus ponens on R_8 and $R_4: \neg B_{1,1}$

$$R_8: \neg (P_{1,2} \vee P_{2,1})$$

• De Morgan's rules: $R_9: \neg P_{1,2} \wedge \neg P_{2,1}$

nstructor's notes #11 March 31, 2006

22

The job of an inference procedure is to construct proofs by finding appropriate sequences of applications of inference rules

starting with sentences initially in KB and culminating in the generation of the sentence whose proof is desired

24

Complexity of propositional inference

Truth-table: Sound and complete.

 2^n rows: exponential, thus impractical

Entailment is co-NP-Complete in Propositional Logic

Inference rules: sound (resolution gives completeness)

NP-complete in general

However, we can focus on the sentences and propositions of interest: The truth values of all propositions need not be considered

Monotonicity

the set of entailed sentences can only increase as information (new sentences) is added to the KB:

if KB
$$\models \alpha$$
 then (KB $\land \beta$) $\models \alpha$

25

Instructor's notes #11 March 31, 2006 Monotonicity allows us to apply inference rules whenever suitable premises appear in the KB: the conclusion of the rule follow regardless of what else is in the KB

PL, FOL are monotonic, probability theory is not

Monotonicity essential for soundness of inference

B.Y. Choueiry

Resolution for completeness of inference rules

• Unit resolution:

$$\frac{l_1 \vee l_2, \ \neg l_2}{l_1}$$

More generally:

$$\frac{l_1 \vee \cdots \vee l_k, \ m}{l_1 \vee \cdots \vee l_{i-1} \vee l_{i+1} \vee \cdots \vee l_k}$$

26

where l_i and m are complementary literals

• Resolution:

$$\frac{l_1 \vee l_2, \ \neg l_2 \vee l_3}{l_1 \vee l_3}$$

More generally:

$$\frac{l_1 \vee \cdots \vee l_k, \ m_1 \vee \cdots \vee m_n}{l_1 \vee \cdots \vee l_{i-1} \vee l_{i+1} \vee \cdots \vee l_k \vee m_1 \vee \cdots \vee m_{j-1} \vee m_{j+1} \vee \cdots \vee m_n}$$
where l_i and m_j are complementary literals

 $Agent\ goes\ [1,\ 1],\ [2,\ 1],\ [1,\ 1],\ [1,\ 2]$

Agent perceives a stench but no breeze: $R_{11}: \neg B_{1,2}$

But $R_{12}: B_{1,2} \Leftrightarrow (P_{1,1} \vee P_{2,2} \vee P_{1,3})$

Applying biconditional elimination to R_{12} , followed by and-elimination, contraposition, and finally modus ponens with

 R_{11} , we get:

 $R_{13}: \neg P_{2,2} \text{ and } R_{14}: \neg P_{1,3}$

 $R_3: B_{2,1} \Leftrightarrow (P_{1,1} \vee P_{2,2} \vee P_{3,1})$

 $R_5: B_{2,1}$

Now, applying biconditional elimination too R_3 and modus ponens with R_5 , we get:

 $R_{15}: P_{1,1} \vee P_{2,2} \vee P_{3,1}$

Resolving R_{13} and R_{15} : $R_{16}: P_{1,1} \vee P_{3,1}$

Resolving R_{16} and R_{1} : $R_{17}: P_{3,1}$

Instructor's notes #11 March 31, 2006

B.Y. Choueiry

Soundness of the resolution rule

Resolution rule: $\frac{\alpha \vee \beta, \ \neg \beta \vee \gamma}{\alpha \vee \gamma}$ or equivalently $\frac{\neg \alpha \Rightarrow \beta, \ \beta \Rightarrow \gamma}{\neg \alpha \Rightarrow \gamma}$

α	β	γ	$\alpha \vee \beta$	$\neg \beta \vee \gamma$	$\alpha \vee \gamma$
False	False	False	False	True	False
False	False	True	False	True	True
False	True	False	True	False	False
<u>False</u>	<u>True</u>	<u>True</u>	<u>True</u>	<u>True</u>	<u>True</u>
<u>True</u>	<u>False</u>	<u>False</u>	<u>True</u>	<u>True</u>	<u>True</u>
<u>True</u>	<u>False</u>	<u>True</u>	<u>True</u>	<u>True</u>	<u>True</u>
True	True	False	True	False	True
<u>True</u>	<u>True</u>	<u>True</u>	<u>True</u>	<u>True</u>	<u>True</u>

28

Instructor's notes #1: March 31, 2006 Resolution for completeness of inference rules

- Inference rules can be used as successor functions in a search-based agent
- Any complete search algorithm, applying only the resolution rule, can derive any conclusion entailed by any knowledge base in propositional logic.
- Refutation completeness:

 Resolution can always be used to either prove or refute a sentence
 - \longrightarrow Resolution algorithm on CNF
- Caveat:

Resolution cannot be used to enumerate true sentences. Given A is true, resolution cannot generate $A \vee B$

Conjunctive Normal Form

- Resolution applies only to disjunctions of literals
- We can transform any sentence in PL in CNF
- A k-CNF has exactly k literals per clause: $(l_{1,1} \vee \cdots \vee l_{1,k}) \wedge \cdots \wedge (l_{n,1} \vee \cdots \vee l_{n,k})$

Conversion procedure:

- \bullet Eliminate \Leftrightarrow using bicondictional elimination
- Eliminate \Rightarrow using implication elimination
- \bullet Move \neg inwards using (repeatedly) double-negation elimination and de Morgan rules
- Apply distributivity law, distributing \vee over \wedge whenever possible

Finally, the KB can be used as input to a resolution procedure

30

Example of conversion to CNF

 $R_2: B_{1,1} \Leftrightarrow (P_{1,2} \vee P_{2,1})$

- Eliminate \Rightarrow using bicondictional elimination $(B_{1,1} \Rightarrow (P_{1,2} \lor P_{2,1})) \land ((P_{1,2} \lor P_{2,1}) \Rightarrow B_{1,1})$
 - Eliminate \Rightarrow using implication elimination $(\neg B_{1,1} \lor (P_{1,2} \lor P_{2,1})) \land (\neg (P_{1,2} \lor P_{2,1}) \lor B_{1,1})$
 - Move \neg inwards using (repeatedly) double-negation elimination and de Morgan rules $(\neg B_{1,1} \lor (P_{1,2} \lor P_{2,1})) \land (\neg P_{1,2} \land \neg P_{2,1}) \lor B_{1,1})$
 - Apply distributivity law, distributing \vee over \wedge whenever possible $(\neg B_{1,1} \vee P_{1,2} \vee P_{2,1}) \wedge (\neg P_{1,2} \vee B_{1,1}) \wedge (\neg P_{2,1} \vee B_{1,1})$

Instructor's notes #11 March 31, 2006

32

Resolution algorithm

- KB $\models \alpha$ iff (KB $\land \neg \alpha$) is unsatisfiable
- (KB $\wedge \neg \alpha$) is converted to CNF then we apply resolution rule repeatedly, until:
 - no clause can be added (i.e., KB $\models \neg \alpha$)
 - we derive the empty clause (i.e., KB $\models \alpha$)

<PL-RESOLUTION(KB, α), Fig 7.12, page 216>

• Ground resolution theorem:

If a set of clauses is unsatisfiable, then the resolution closure of those clauses contains the empty clause.

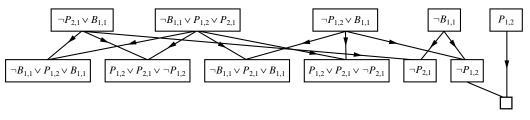

Example of applying resolution algorithm to wumpus world

With KB= $R_2 \wedge R_4$, prove that $\neg P_{1,2}$

 $R_2: B_{1,1} \Leftrightarrow (P_{1,2} \vee P_{2,1})$

 $R_4: \neg B_{1,1}$

33

Note that many steps are pointless and could be avoided, example:

 $B_{1,1} \vee P_{2,1} \vee \neg B_{1,1} = True \vee P_{2,1} = True$

B.Y. C

Instructor's notes #11 March 31, 2006

Restriction to Horn clauses: a subset of PL

• Disjunctive form: disjunction of literals of which at most one is positive

Example: $\neg P_1 \lor \neg P_2 \lor \cdots \lor \neg P_n \lor Q$ where P_i and Q are non-negated atoms

• Implicative form: an implication whose premise is a conjunction of literals and whose conclusion is a single positive literal Example: $P_1 \wedge P_2 \wedge \ldots P_n \Rightarrow Q$, where P_i and Q are non-negated atoms

Significance of Horn clauses:

- Real-world KB's are easy to write in implicative form
- Inference can be done with Forward and Backward chaining (easy to trace and understand) PL-FC-ENTAILS?(KB, q)
- Deciding entailment with Horn clauses is linear time

B.Y. Choueiry

<u>ر</u>

Forward chaining PL-FC-Entails?(KB, q)

- ullet determines whether p is entailed by a KB of Horn clauses
- begins with known facts
- asserts the conclusion (head) of an implication whose premises hold
- continues until the query q is added to KB (success) or no further inferences can be made (failure)

Forward chaining terminates (reaches a fixed point), is sound and complete

Instructor's notes #11 March 31, 2006

B.Y. Choueiry

Execution example of Forward chaining

KB: $(P \Rightarrow Q) \land (L \land M \Rightarrow P) \land (B \land L \Rightarrow M) \land (A \land P \Rightarrow L) \land (A \land B \Rightarrow L) \land A \land B$

ಭ

Inference in Horn theories

Runs in linear time

- Forward chaining:
 - data-driven
 - infers every possible conclusion
 - may do lots of work that is irrelevant to the goal
- Backward chaining:
 - goal-directed reasoning
 - works back from q, tries to find known facts that support the query
 - touches only relevant facts, often cost much less than linear in the size of KB

Instructor's notes #11 March 31, 2006

B.Y. Choueiry

Problems with Propositional Logic

- good vehicle for introducing what logic / inference is
- too weak to even handle the Wumpus world 'Don't go forward when Wumpus is in front of you' requires 64 rules (16 squares x 4 orientations for agent)
- Problem: generating rules, handling truth tables $(2^n \text{ rows for } n \text{ symbols})!$
- Important problem: How to represent change when agent moves from [1, 1] to [1, 2]?

Solution: Time-stamp symbols :-(

But (1) length of game is not known in advance, (2) rewrite a time-dependent version of each rule..

Problem: PL only allows propositions, no relations, no objects

Summary

Logical agents apply <u>inference</u> to a <u>knowledge base</u> to derive new information and make decisions

Basic concepts of logic:

- Syntax: formal structure of sentences
- Semantics: truth of sentences WRT models
- Entailment: necessary truth of one sentence given another
- **Inference**: deriving sentences from other sentences
- **Soundness**: derivations produce only entailed sentences
- Completeness: derivations can produce all entailed sentences
- Truth-table method is sound and complete for propositional logic
- Forward and backward chaining are linear-time, sound and complete for Horn clauses
- Resolution is complete for propositional logic
- \longrightarrow Propositional logic suffices for some of these tasks, not all

9
